5 September 1957

Dear [REDACTED]

As mentioned in our conversation via phone on September 4, 1957, the letter to you from [REDACTED] was discussed with reference to the detonation scheme for the 9-1/2 inch processors. It is felt that the [REDACTED]

[REDACTED] is satisfactory, however, we should not rely on using 100 grain/foot primacord to detonate it. To be consistent with the overall system, primacord [REDACTED] should be used to reliably detonate the explosive. If you wish, the primacord that will actually be used with the final system can be supplied for your testing, however, it is dimensionally the same as the [REDACTED] primacord referred to in the proposed scheme.

Detonating reliability would probably be increased if the metal end cap, which is pinched on the end of primacord inserted in the spear, [REDACTED]

If any questions arise, please contact me through Rick, otherwise, I will be looking forward to the firing here.

Very truly yours,

:dm
